Craig Haworth, Plant Manager

G-P Gypsum is the only major supplier of fire-rated door components that doesn't also manufacture its own fire doors. Instead, they concentrate on developing, testing, certifying and manufacturing a full range of high performance fire door components.

They test and obtain certification of wood composite fire doors for the United States and Canadian markets. In addition, their mineral core is approved for use in steel doors as an insulator. Working principally with Intertek - ETL Semko so that doors built with their components can carry the Warnock Hersey label, their fire testing yields an extensive set of manufacturing and machining specifications. These specifications are written, approved for engineering validity, and distributed by testing authorities, are made available at their discretion to door manufacturers that build their fire door programs around GP components.

With the adoption of UBC 7-2 (1997), G-P Gypsum has emerged as an industry leader in developing a comprehensive set of design options that address the new demands of positive pressure requirements.
