LiquidArt, LLC offers artificial column rocks for use with their pondless water fountains. Each artificial rock looks and feels like natural basalt column. They provide the same function to their water features as natural stone but have a tremendous weight savings advantage. Our artificial rocks weigh, on average, 40lbs. to 110lbs per rock compared to several hundred lbs for a comparable natural rock. The weight savings is possible because of LiquidArt's proprietary blend of glass fiber reinforced concrete (GFRC). GFRC is cast into molds, made from natural rock, cured and then colored to desired specifications to create a natural look. GFRC is used at many theme parks, zoos and museums to create a natural rock look and texture that stand up to the elements over time. LiquidArt has applied the same technology to their fountain rocks to create very real looking replicas of nature's own version of column rock.

“When most people see the rocks for the first time they have no idea they are artificial. After you explain that the rocks are synthetic, they immediately have to touch, tap and push on them before being convinced they are not real.”
