VATA, Inc. was established in May 1987 with a single product, Chester Chest. This model was created because, as a sales representative for an IVAD/port manufacturer, a newer product at the time, the founder, Tom Call, became aware that a training model was needed as staff could only learn and practice on patients. This was not an acceptable method for anyone involved. Chester Chest has continued to be a most useful teaching model, now being used throughout the US and in 21 foreign countries.

They continue to add new products as customers suggest a need. They have found the best products come from involving the clinician at the earliest stages of research and development, assuring that the end product provides the highest level of realism and function for the procedures you need to learn. As procedures and protocols can be regional, VATA always receives the input of several respected clinicians to make sure they have "covered all the bases". Their concern is not solely with the improved competency and professionalism of the clinician but also in maintaining patient autonomy with the use of realistic educational health care models. It has been gratifying for them to hear from many patients and families of the positive learning experiences they have encountered using their models.
