Clutch Align-
ment Tools

Quick Disconnect

Donovan West developed the first marketable clutch alignment tool from turning a piece of wooden dowel using a lathe to match the internal dimensions of any particular clutch disc and pilot bearing combination. After several years of manufacturing alignment tools in this manner, he began using a manufacturing process utilizing thermoset polymers. This proved to be almost as inefficient as the lathe process. The company moved to injection molding utilizing thermoplastics and continues to manufacture products with this method.

In 1998, Steve Stamback acquired West Automotives Products and manufactures specialty automotive tools to the automotive aftermarket, including: clutch alignment tools, quick disconnect tools, seal installers, transmission plugs, and trimming chain removal tools.

West Automotive Product's idea is to create raving fans out of their customers. "It is simply not good enough to satisfy our customers, because their expectation levels are set so low." Says owner Steve Stamback, "We want to become the absolute best supplier in the automotive industry. In order to become the best we must create 'raving fans.'"
