Willamette Plastics specializes in pressure and vacuum formed plastic parts. Located just off I-5 in Canby, Oregon, They have been designing and manufacturing thermoformed parts using the latest equipment and technology for over 20 years.

Two methods of plastic production exist: vacuum forming and pressure forming. Both evacuate air from the sealed space between a heated plastic sheet and a mold to make the sheet conform to the mold. Pressure forming is for parts requiring higher precision and features such as sharp undercuts; to achieve these features, compressed air is added to the operation, from 20 to as much as 150 psi.

For fast set-up and production of plastic parts, especially large parts, thermforming or pressure forming with sheet plastics has become the processing method of choice.
